About Us

We are a small backyard, home grown business that is based in Harford County Maryland. We are family operated and mentored from a fellow bee keeping expert on the Eastern shore. This all started from a small project back in highschool that grew into something of a longlasting community.

We hope to connect with you soon!

Our Values

Family Oriented

Fun Facts

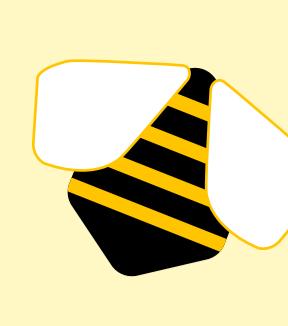

In a single hive, it is made up of Worker (female) bees, Drone (male) bees and the Queen.

Honey bees fly at 25km per hour and beat their wings 200 times per second!

The average lifespan for a typical working honey bee is six weeks.

If the Queen bee dies they feed royal honey to a few young larva to make more.

One bee has 170 odor receptors that help them communicate and look for food sources.

Liquid Gold

*light honey color
*lighter flavors

Spring

In the spring the nectar collected from bees is typically lighter in color resulting in a lighter honey color. The taste is also described as a milder sweetness. Below are some flowers that you can plant to get this pale and mellow flavor.

Summer

In the summer the nectar collected from bees is typically darker in color resulting in a golden honey color. The taste is also described as more complex and richer.

Below are some flowers that you can plant to get this pale and mellow flavor.

*medium color
*fruitier flavors

*darker color
*sharper flavors

Autumn

In the autumn season the nectar collected from bees is typically amber in color resulting in a darker honey color. The taste is also described as a earthier and heartier flavor.

Below are some flowers that you can plant to get this sharper flavors.

Winter

In the winter the honey is usually the darkest in color. Beekeepers typically harvest the honey but leave enough for the bees to survive the winter months. The flavors are based on late summer/fall notes and super hearty.
